

How to run the script.

The script mainly divided in three parts.

The first part is to load data, the second is to visualize data and find the relationship between the parameters. The third one is to build two models to make regression and create a simple application that can let people enter information and get an estimate of their house price. This is a logic to make data analysis and build model to find the inner relationship for house price prediction. You can run from the top to the end to find this relationship and when you have something difficult to understand, you can read the write-up.

Thanks for your reading.
